# VRV<sup>®</sup>III-Q - Replacement VRV<sup>®</sup> The Daikin Solution to R-22 Phase Out

Due to significant developments in heat pump technology, older systems of air conditioning run less efficiently than those available today. Furthermore R-22 will soon be unavailable for servicing these units. To upgrade R-22 systems as cost effective as possible, Daikin replacement VRV<sup>®</sup> units can be installed using existing pipe-work.

# What is R-22 and why is it phased-out in Europe?

R-22 is a hydrochlorofluorocarbon (HCFC) which was commonly used in air conditioning systems. When R-22 is released into the air, the ultraviolet rays of the sun cause it to decompose and chlorine is released in the stratosphere. Chlorine reacts with ozone, reducing the amount of the ozone. Due to ozone layer depletion, harmful ultraviolet rays reach the surface of the earth giving rise to a number of health and environmental issues. The international community therefore, signed the Montreal Protocol to phase out ozone depletion materials by 2030. The European Union however, decided to ban R-22 already in 2015.

Daikin advises to replace your existing installation already today.

## When will R-22 be banned in Europe?

<sup>1</sup> Recycled: re-use of R-22 following a basic cleaning process. Recycled R-22 must be re-used by the same company that carried out the recovery (can be done by installer) Reclaimed: reprocessed R-22 in order to meet the equivalent performance of virgin R-22 (by specialized company)

# What is the Impact on an R-22 Installation?

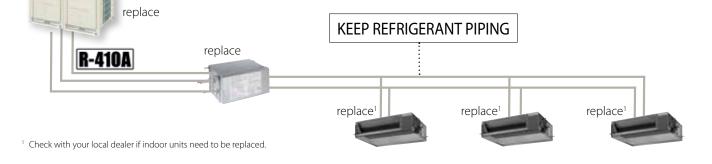

The R-22 phase-out regulation will impact on all currently operating R-22 systems, although reliable R-22 equipment does not need to be replaced immediately because maintenance can be carried out with recycled or reclaimed R-22 until January 1st, 2015. However, currently not enough R-22 is reclaimed or recycled to cover the demand, supply shortages and price increases are expected. If there is no reclaimed or recycled R-22 available, certain repairs (for example: compressor

change) are no longer possible and considerable air conditioning system downtime can occur. It is therefore worthwhile to consider a replacement system before 2015, especially for air conditioning systems with a large impact on the daily running of the business.

# What should be replaced?

Replace your R-22 / R-407C outdoor unit with R-410A technology, but keep your refrigerant piping and in some cases your indoor units<sup>1</sup>. In case your indoor units can remain, works only need to be carried out at the outdoor unit and not inside your building (in case of a heat pump installation).

- 1. Replace outdoor unit
- 2. Replace BS-boxes (in case of H/R)
- 3. Replace indoor units (check with your local dealer if needed)
- 4. The system will automatically clean the piping & charge the correct amount of R-410A refrigerant

# Features of VRV®III-Q

#### **Fast Installation**

It is not necessary to remove the existing piping and even the indoor units can remain (depending on type of indoor unit). This means work only has to be carried out at the outdoor unit and not inside your building in case of a heat pump installation. The outdoor unit automatically charges the refrigerant and cleans the refrigerant piping. This unique Daikin feature makes the installation time even shorter.

#### **No Limitations on System History**

As a result of the combined automatic charging and refrigerant pipe cleaning function, it is possible to ensure a clean piping network, even when a compressor breakdown has previously occurred.

In this way all correct installed R-22 and R-407C VRV  $\ensuremath{^\circ}$  systems can be replaced.

#### Limited and Planned-Downtime

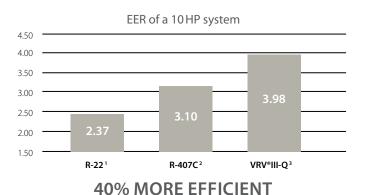

As the refrigerant piping can be maintained the installation is less intrusive and less time consuming than for a completely new system. Moreover, downtime can be carefully planned: whereas if a problem occurs when not enough reclaimed R-22 is available, a long and unplanned downtime can be the result.

#### Limited and Phased Investment Cost

It is possible to spread the various stages of replacement over a certain period of time because the indoor units can remain in most cases. The air conditioning replacement therefore, can be incorporated in the general refurbishment schedule of the building and the investment cost can be spread. A further reduction in installation cost can be achieved by maintaining the old refrigerant copper pipe work.

#### **High Efficiency**

Upgrading an old R-22 system to a Replacement VRV®system will result in increased system efficiency. Efficiency gains of more than 40% in cooling can be realized, by virtue of technological developments in current heat pump technology and the more efficient R-410A refrigerant. Increased energy efficiency equals lower energy consumption, subsequent lower energy costs and lower CO<sub>2</sub> emissions.

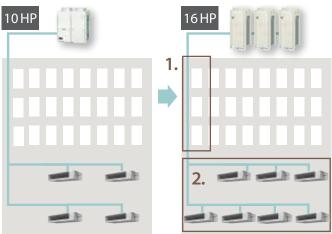

# COP of a 10 HP system 4.50 4.00 3.50 3.00 2.50 3.00 3.00 3.10 4.00 4.00 4.00 5.0 R-22' R-407C<sup>2</sup> VRV\*III-Q<sup>3</sup> 25% MORE EFFICIENT

#### **Environmental Awareness**

R-410A not only has a zero ozone depletion potential, it is also proven to be more energy efficient than R-22.

#### **Possibility to Increase Capacity**

Cooling loads often increase subsequent to the initial installation of the air conditioning system. The Replacement VRV®(VRV®III-Q) enables system capacity to be increased without changing the refrigerant piping (depending on system characteristics). For example: It is possible to install a 16 HP Replacement VRV® on the refrigerant piping of an R-22 10 HP system.

Keep main piping
 Install indoor units with a higher total capacity

1 R-22: RSXY10KA7

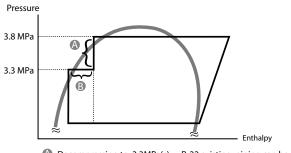

<sup>2</sup> R-407C: RSXYP10L7

3 R-410A: RQYQ280P

# Technologies of VRV®III-Q

#### **Reduced Pressure**

As R-22 VRV® systems used to work on a lower pressure than R-410A systems; thus the copper refrigerant piping was also designed for these lower pressures. Therefore the Replacement VRV® (VRV®III-Q) must operate at lower pressures than the standard VRV®III series. However thanks to the sub cool circuit a high efficiency level can be kept even with the lower pressures.

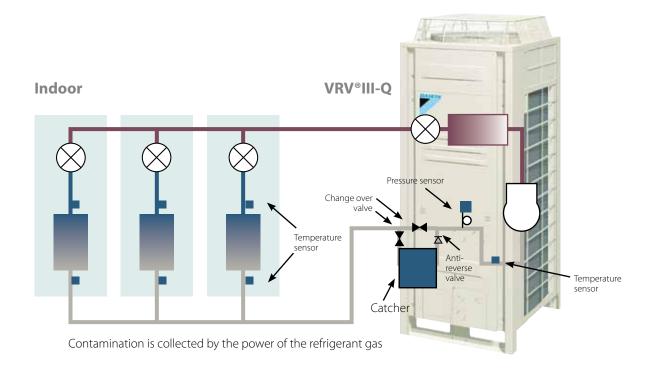

#### **Refrigerant Pipe Cleaning**

When replacing an air conditioning system, the piping is normally replaced as well since traces of old refrigerant and oil mixed with the oil and refrigerant of the new system can cause the equipment to malfunction.

In order to allow re-use of existing R-22 piping with an R-410A system Daikin developed a technology to capture and retain the contamination left in the refrigerant piping. During the charging of the system, R-410A refrigerant starts circulating through the copper

piping collecting the contamination left in the refrigerant piping. The refrigerant including the remaining oil from the R-22 system is filtered in the outdoor unit and the contamination is deposited in the outdoor unit. This process is executed only once and takes about 1 hour (depending on system characteristics). Daikin is the first manufacturer in the industry to develop this combination of automatic charging and refrigerant pipe cleaning function.

Notes:

Nominal cooling capacities are based on : indoor temperature: 27°CDB, 19°CWB, outdoor temperature: 35°CDB, equivalent refrigerant piping: 7.5m, level difference: 0m. Nominal heating capacities are based on: indoor temperature: 20°CDB, outdoor temperature: 7°CDB, 6°CWB, equivalent refrigerant piping: 7.5m, level difference: 0m

Daikin's unique position as a manufacturer of air conditioning equipment, compressors and refrigerants has led to its close involvement in environmental issues. For several years Daikin has had the intention to become a leader in the provision of products that have limited impact on the environment. This challenge demands the eco design and development of a wide range of products and an energy management system, resulting in energy conservation and a reduction of waste.

VRV® products are not within the scope of the Eurovent certification programme.
